

% of Users with LLM Tag-Profession Mismatch by Organization

This chart shows the number and percentage of users per organization whose LLM tag does not align with their documented profession.

Definition: A mismatch occurs when a user's LLM tag (e.g., therapy-focused) does not align with their clinical role. "Therapy" tags are expected for licensed behavioral health providers (e.g., LCSWs, Psychologists). "Non-therapy tags" are expected for case management or support roles (e.g., CMs, Peer Specialists). Any deviation from this alignment is flagged as a mismatch.

Breakdown of Therapist Professions Among ...

Top Organizations by LLM-Tag Mismatch
